

Hw10 question 2 solution

String1 = "toY"

String2 = "box"

String3 = "cAr"

String4 = "to"

Integer1 = 2

Answer:

```
=====
(a) print(string2.upper())
    BOX
(b) print(len(string4))
    2
(c) print(str(integer1).join(string3.swapcase()))
    C2a2R
(d) print(string4.index(string1))
    Error
(e) print(string1.index(string4))
    0
(f) print("string4" in string1)
    False
```

(d)

error occur because you can only find the substring's index if it is exist in the string.
